

<https://github.com/Nebul4s/Software-Testing/tree/main/Task%204>

The screenshot shows a VS Code editor with a terminal window open. The terminal displays the output of running tests for a project named 'dog-starter-template'. The tests passed, but there was an unhandled error during the test run. The error message is:

```
Serialized Error: { code: 'EADDRINUSE', error: -4091, syscall: 'listen', address: '::', port: 5000 }
This error originated in "tests/dogApi.test.ts" test file. It doesn't mean the error was thrown inside the file itself, but while it was running.
```

The error message indicates that the address (port 5000) is already in use. The terminal also shows the test results:

```
Test Files 4 passed (4)
Tests 5 passed (5)
Errors 1 error
Start at 13:57:55
Duration 580ms (transform 149ms, setup 0ms, import 720ms, tests 30ms, environment 0ms)
```

The terminal output also shows the server running on http://localhost:5000 and the dog API endpoint at http://localhost:5000/api/dogs/random. The error message is repeated in the terminal output.
